Exponential-sum problem: exact search and the lecture baseline
(a) Objective value
After the first update
$f^\star = 2.559267$
Objective value $f(x^{(k)})$
Update index k
(b) Suboptimality on a logarithmic scale
Exact search (21 updates)
Backtracking $\alpha = 0.1,\ \beta = 0.7$ (36 updates)
Objective gap $f(x^{(k)}) - f^\star$
Update index k
